

MAXI

Large Breed Adult 25™

Health Nutrition for large breed dogs from 15 months to 5 years of age

Strong But Sensitive

MAXI dogs have been famed for the services they provide to man. They have an exceptional sense of smell, are courageous and extremely loyal. Their size means that they are more prone to sensitive joints, their digestive capacity is lower than that of smaller dogs and they feel the effects of aging earlier. All of these factors must be taken into account in their food.

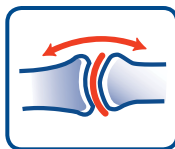

Easy to Digest

MAXI dogs have more difficulty digesting their food than small breed dogs because of the proportionally smaller size of their digestive tract. High quality protein sources (chicken meal, egg and corn gluten meal), high quality carbohydrate sources and beet pulp help to promote optimal digestion.

Ideal Body Weight

It is important to keep your MAXI dog at an ideal weight to ensure optimal health. The combination of a moderate fat content (16%) and optimal protein content (25%) helps to limit weight gain while maintaining your MAXI dog's muscle mass.

Healthy Joints

MAXI dogs tend to put a lot of pressure on their joints. The addition of glucosamine and chondroitin helps to protect the joints. Additionally, Omega 3 essential fatty acids from anchovy oil help limit inflammation of the joints.
